

# Sulfate Distribution in New Mexico Private Wells

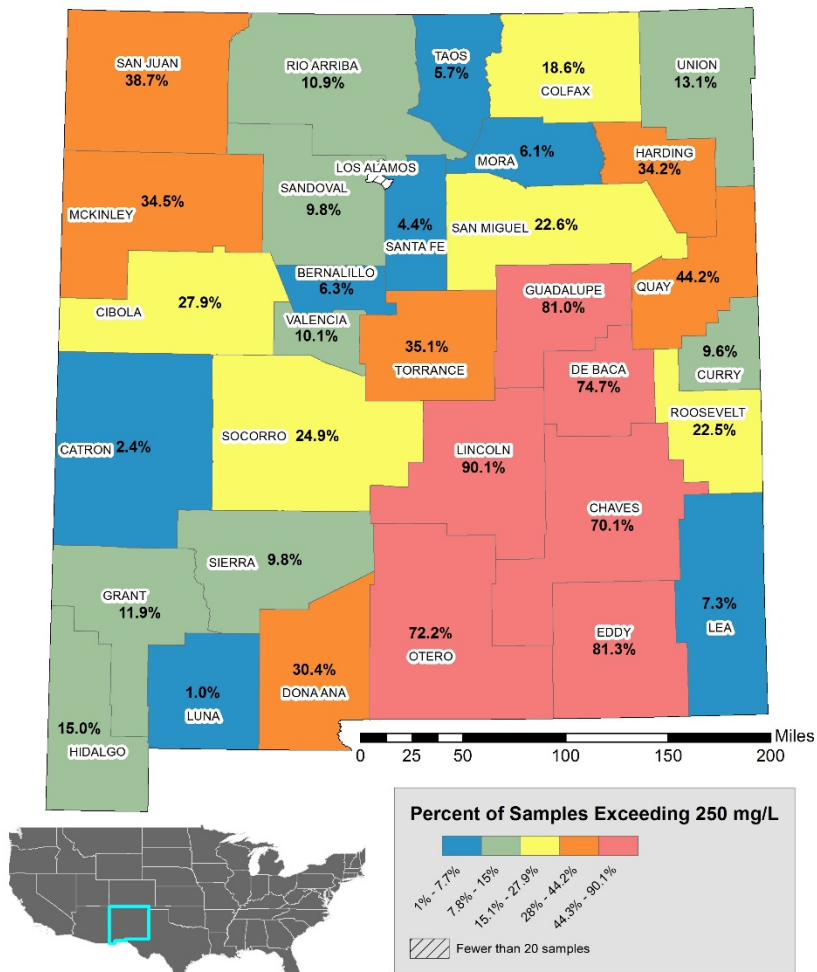

Wells Sampled July August 1903 - October 2018

Sulfate levels in water samples from private wells vary between New Mexico counties and even within the same county. The groundwater system in New Mexico is very complex. This complexity can lead to sulfate concentration variability even amongst neighboring wells. **Therefore, to know the sulfate concentration in your water from your own well, you need to test.** The secondary safe drinking water concentration for sulfate, related to aesthetics (odor and taste), is 250 milligrams per liter (mg/L). Some of the water samples from wells in all counties appear to exceed this Environmental Protection Agency (EPA) Safe Drinking Water secondary standard. However, counties with at least 45 percent of samples that exceed this standard are in south eastern NM.

## Sulfate Distribution in New Mexico Private Wells

Wells Sampled August 1903 - October 2018

**Percentage of Samples Exceeding the EPA Secondary MCL of 250 mg/L for Sulfate**

Data Sources: NMED Water Fairs, NMBGMR, USEPA, USGS NWIS, NMDOH biomonitoring, Bernalillo County, Santa Fe County

# New Mexico Private Wells Inventory

Sulfate Test Results Summary August 1903 - October 2018

County	Number of tests	% Tests above secondary MCL (250 mg/L)	Concentration of Sulfate in Milligrams per Liter (mg/L)						
			Mean	Standard Deviation	Max	95th Percentile	Median	5th Percentile	Minimum Detected Value*
Bernalillo	2177	6.3	112.6	318.7	7850	300	60.0	15.0	0.06
Catron	252	2.4	40.1	78.1	649	148	16.2	3.2	0.50
